

SPRING BOOT 5

Exercise: IoC with AspectJ AOP

Develop an application with the following design model. Wire the beans with annotations and Java Configuration, appropriately. Develop validation aspect on the lines of AOP. Configure in such way that all the methods in the service classes must validate their input.

In the mai() method of com.glarimy.spring.bank.console.BankConsole, get the Bank bean from the context, open an account and print the account number on the console. Verify that customer data is being validated via AOP, while opening the account.
